## 8MHz, 64-Channel Serial to Parallel Converter with Push-Pull Outputs

## Features

- HVCMOS ${ }^{\circledR}$ technology
- 5.0V CMS Logic
- Output voltage up to +80 V
- Low power level shifting
- 8.0 MHz data rate
- Latched data outputs
- Forward and reverse shifting options (DIR pin)
- Diode to VPP allows efficient power recovery
- Outputs may be hot switched

## General Description

The HV57908 is a low voltage serial to high voltage parallel converter with push-pull outputs. The device has been designed for use as a driver for EL displays. It can also be used in any application requiring multiple output high voltage current sourcing and sinking capability such as driving plasma panels, vacuum fluorescent displays, or large matrix LCD displays.

The device consists of a 64-bit shift register, 64 latches and control logic to perform the polarity select and blanking of the outputs. $\mathrm{HV}_{\text {OUT }} 1$ is connected to the first stage of the first shift register through the polarity and blanking logic. Data is shifted through the shift registers on the logic low to high transition of the clock. The DIR pin causes CCW shifting when connected to GND, and CW shifting when connected to VDD. A data output buffer is provided for cascading devices. This output reflects the current status of the last bit of the shift register ( $\mathrm{HV}_{\text {OUT }} 64$ ). Operation of the shift register is not affected by the $\overline{\mathrm{LE}}$ (latch enable), $\overline{\mathrm{BL}}$ (blanking), or the $\overline{\mathrm{POL}}$ (polarity) inputs. Transfer of data from the shift registers to the latches occurs when the $\overline{\mathrm{LE}}$ input is high. The data in the latches is stored when the $\overline{\mathrm{LE}}$ is low.

## Absolute Maximum Ratings

| Parameter | Value |
| :--- | ---: |
| Supply voltage, $\mathrm{V}_{\mathrm{DD}}$ | -0.5 V to +7.5 V |
| Output voltage, $\mathrm{V}_{\mathrm{PP}}$ | -0.5 V to +90 V |
| Logic input levels | -0.3 V to $\mathrm{V}_{\mathrm{DD}}+0.3 \mathrm{~V}$ |
| Ground current ${ }^{1}$ | 1.5 A |
| Continuous total power dissipation ${ }^{2}$ | 1200 mW |
| Operating temperature range | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ |
| Storage temperature range | $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$ |

Absolute Maximum Ratings are those values beyond which damage to the device may occur. Functional operation under these conditions is not implied. Continuous operation of the device at the absolute rating level may affect device reliability. All voltages are referenced to device ground.

## Notes:

1. Limited by the total dissipated in the package.
2. For operation above $25^{\circ} \mathrm{C}$ ambiant derate linearly to maximum operating temperature at $20 \mathrm{~mW} /{ }^{\circ} \mathrm{C}$.

## Notes:

Pin designation for DIR $=H / L$.
Example:For DIR = H, pin 41 is $H V_{\text {OUT }} 64$.
For DIR $=L$, pin 41 is $H V_{\text {OUT }} 1$.
