## DESCRIPTION

Micrel-Synergy's SY604 is an ECL-compatible timing vernier (delay generator) whose time delay is programmed via an 8bit code which is loaded concurrently with the circuit trigger. The SY604 is fabricated in Micrel-Synergy's proprietary ASSET™ bipolar process.

This device can be retriggered at speeds up to 125 MHz , with a delay span as short as $4 n s$. At minimum span, the resolution is $4 \mathrm{~ns} / 255=15.7 \mathrm{ps}$ per step. The delay span is externally adjustable up to 40 ns . The SY604 employs differential TRIGGER inputs, and produces a differential OUTPUT pulse; all other control signals are single-ended ECL. Edge delay is specified by an 8-bit input which is loaded into the device with the TRIGGER. The output pulse width will typically be 3.5 ns .

The SY604 is commonly used in Automatic Test Equipment to provide precise timing edge placement; it is also found in many instrumentation and communications applications.

Micrel-Synergy's circuit design techniques coupled with ASSET ${ }^{\text {TM }}$ technology result in not only ultra-fast performance, but allow device operation at lower power dissipation than competing technologies. Outstanding reliability is achieved in volume production.

## PIN CONFIGURATION

## PIN DESCRIPTION

D0 - D7
Data input pins (ECL compatible). On the rising edge of TRIG, a ramp is initiated whereupon D0-D7 are latched into the device. D0 is the LSB. These inputs specify the amount of delay from the rising edge of TRIG to the output pulse.

## $\overline{C E}$

Chip enable input (ECL compatible). CE must be a logical zero on the rising edge of TRIG to enable the device to respond to the trigger. If CE is floating, the trigger will always be enabled.

## TRIG, TRIG

Differential trigger inputs (ECL compatible). The rising edge of TRIG is used to trigger the delay cycle if $\overline{C E}$ is a logical zero. If $\overline{C E}$ is a logical one, no operation occurs. It is recommended that triggering be performed with differential inputs.

## OUT, $\overline{\text { OUT }}$

Differential outputs (ECL compatible).

## IEXT

Current reference pin. The amount of current sourced into this pin determines the span of output delay. The voltage at IEXT is typically -1.25 V .

## COMP1, COMP2

Compensation pins. A $0.1 \mu \mathrm{~F}$ ceramic capacitor must be connected between COMP1 and VEEO, and COMP2 and VEEO (see Figure 3).

## Vee

Device power. All Vee pins must be connected.
Vcc
Device ground. All Vcc pins must be connected together.
Vbb
A -1.36 V (typical) output.

## FUNCTIONAL DESCRIPTION

The output pulse generation cycle begins with the arrival of TRIG shown in Figure 1. When TRIG transitions to a high and $\overline{C E}$ is low, the values on D0-D7 are latched, thereby setting the DAC values. Simultaneously with the latching of D0-D7, the linear ramp generator is enabled.

When the ramp level reaches that of the DAC, the comparator initiates the pulse generator to produce an output pulse of fixed width. The generation of an output pulse resets the ramp and the cycle is ready to begin again.

Figure 1.

## ABSOLUTE MAXIMUM RATING ${ }^{(1)}$

| Symbol | Parameter | Value | Unit |
| :--- | :--- | :---: | :---: |
| VEE | Power Supply (VCC $=0 \mathrm{~V})$ | -8 to 0 | V |
| VI | Input Voltage (VCC $=0 \mathrm{~V})$ | 0 to VEE | V |
| IOUT | Output Current |  |  |
|  | - Continuous | 50 | mA |
|  | - Surge | 100 |  |
| TA | Operating Temperature Range | 0 to +85 | ${ }^{\circ} \mathrm{C}$ |
| VEE | Operating Range ${ }^{(2)}$ | -5.7 to -4.2 | V |

NOTES:

1. Beyond which device life may be impaired.
2. Parametric values specified at 10 E Series: -4.75 V to -5.5 V .

## NOTE:

1. 10 K series circuits are designed to meet the DC specifications shown in the table after thermal equilibrium has been established. The circuit is in a test socket or mounted on a printed circuit board and transverse air flow greater than 500 lfpm is maintained. Outputs are terminated through a $50 \Omega$ resistor to -2.0 volts.

## AC CHARACTERISTICS

ECL input values are -0.9 to -1.7 V , with input rise/fall times $\leq 2 \mathrm{~ns}$, measured between the $20 \%$ and $80 \%$ points. Timing reference points at $50 \%$ for inputs and outputs.

OUT and OUT loading with $50 \Omega$ to -2.0 V . Typical values are based on nominal temperature, i.e., and nominal voltage, i.e., -5.2 V .

## APPLICATION DIAGRAM

## REXT Calculation:

REXT = (VEXT + 1.25V)/IEXT

For Example:
If Tspan is around 15 ns , then IEXT is around 0.6 mA , (see DC Characteristic Table) and assume IEXT pin is tied to Vcc with the resistor.

$$
\begin{aligned}
\text { REXT } & =0+1.25 \mathrm{~V} / 0.6 \mathrm{~mA} \\
& =2.08 \mathrm{~K} \mathrm{ohm}
\end{aligned}
$$

| Location | Description | Vendor Part Number |
| :--- | :--- | :--- |
| C1-C4 | $0.1 \mu$ F ceramic capacitor | Erie RPE112Z5U104M50V |
| REXT | $1 \%$ metal film resistor <br> (selected for proper Tspan) | CB301210 <br> Dale CMF-55C |

## NOTE:

The vendor numbers above are listed only as a guide. Substitution of devices with similar characteristics will not affect the performance of the SY604. All devices should be as close as possible to the SY604.

Figure 3. Typical Connection Diagram and Parts List.
